

Finger vein reader for SportsMan Membership Admittance

Cuts, dry skin, scars, and other factors can sometimes prevent fingerprint readers from reliably enrolling or identifying a person. The finger vein reader solves this issue by capturing images of the vein patterns inside your finger. These patterns (like other biometric patterns) are unique and because they are inside your body, finger vein patterns are virtually impossible to reverse engineer and replicate.

The finger vein reader works by passing near-infrared light through the finger which is partially absorbed by the hemoglobin in the veins allowing an image to be recorded on a CCD camera. Finger vein authentication is extremely robust, demonstrating a unique ability to easily cope with sweaty, dry, or aged fingers. The finger vein reader is also surprisingly inexpensive, making it a viable choice for biometric identification.

Finger Vein Biometric Scanner (USB)

\$450.00/each

Finger Vein Server/Database license, setup & configuration

\$1000.00/one-time fee
